

CASE STUDY: WATER JET CUTTING BY JETFOX

'Thinking outside the square'

Carpet Tiles, Rubber Tiles or even roll rubber are not just limited by their set square format, depending on the design you can incorporate stylish curvature, graphics and even logos and integrate them right into the floor.

Water Jet Cutting and CNC Routing have long been known and favoured in the automotive and aviation industries for its precise cutting technique and high degree of accuracy & finish allowing for greater flexibility and creativity in designs (dependent on the client). Most materials are able to be used as the process of Water Jet Cutting and CNC Routing do not contain a heat influence which would otherwise affect the material structure.

Jet Fox have been specialising in Water Jet Cutting for over 10 years and have assisted our customers and ourselves with many projects over the years that utilised water jet cutting with tremendous and effective results.

Project: Signature's Indesign stand 2017, Samsung Kids Zone, Fit Kidz Childcare Centre (see separate case study)

Project Brief: Needed to replicate the design accurately. Adhere to specific branding or design, easy to assemble, Signature products desired to be used.

Project Challenges: Precision, and making sure it was easy to layout for installers.

Client Feedback: Loved that they could go from concept to reality easily. Amazed by the precision of the designs in the material. Branding designs for clients were met precisely (if applicable). Multi-Floor and textures able to be used together.
